سوالات تشریحی

سوال اول: (نمره ۲)

الف-

$$q = kh \frac{N_f}{N_d} = 2.5 \times 10^{-5} \times 4.00 \times \frac{4.7}{15} \\ = 3.1 \times 10^{-5} \text{ m}^3/\text{s} \quad (\text{per m})$$

ب-

point	$h_{(m)}$	$z_{(m)}$	$h - z(m)$	$u = \gamma_w (h - z)$ $(kN/m^2)$
4	1.07	-2.10	3.17	31.1
7	1.87	-2.40	4.27	41.9

سوال ۲ - (نمره ۲)

راه حل اول:

$$\sigma_1 - u = (\sigma_3 - u) \tan^2(45 + \phi/2) + 2c \tan(45 + \phi/2) \\ 270 - u = (100 - u) \tan^2(45 + 29/2) + 2 \times 15 \times \tan(45 + 29/2) \\ u \cong 36kN/m^2$$

The modified shear strength parameters are

$$\alpha' = \tan^{-1}(\sin \phi') = \tan^{-1}(\sin 29^\circ) = 26^\circ$$

$$c' = c \cos \phi' = 15 \cos 29^\circ = 13 \text{ kN/m}^2$$

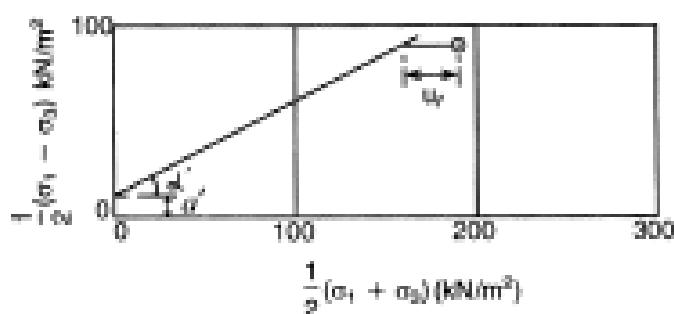

The coordinates of the stress point representing failure conditions in the test are

$$\frac{1}{2}(\sigma_1 - \sigma_3) = \frac{1}{2} \times 170 = 85 \text{ kN/m}^2$$

$$\frac{1}{2}(\sigma_1 + \sigma_3) = \frac{1}{2} (270 + 100) = 185 \text{ kN/m}^2$$

The pore water pressure at failure is given by the horizontal distance between this stress point and the modified failure envelope. Thus from Figure Q4.4

$$u_f = 36 \text{ kN/m}^2$$
